Game Proposal: Ki ni n leje

Objective

Create an interactive and educational app that teaches Yoruba words to kids using the pattern of the traditional Yoruba game "Ki ni n leje" (what has blood). The game prompts players to determine if the given Yoruba word has blood or not.

Game Flow

User Authentication:

Players can sign up or log in using their Google, Apple, Facebook accounts, or play as a guest.

Game Mechanics:

Display an image representing a Yoruba word (e.g., a duck).

Prompt players to choose between "leje leje" (has blood) or "iro nla" (does not have blood).

Players tap the appropriate option based on their understanding of the word.

Audio pronunciation of the Yoruba word enhances the learning experience.

Word Database:

Store Yoruba words with English translations, Yoruba pronunciations, images, and blood indicators.

Additional properties include whether the word represents a living organism or is complex.

Timer and Scoring:

Include a timer to count down the available time for each question.

Calculate player accuracy by comparing correct answers to the total attempted.

Display the player's score as a percentage of correct answers.

Level Completion:

Pass level if the player scores 80% or above.

✖ Fail level if the player scores below 80%.

Provide level completion pop-ups with feedback and encouragement.

Accompany pass/fail outcomes with suitable sound effects.

Technical Implementation

Milestone 1: Project Setup and UI Integration (3 days)

Set up the Unity project and integrate UI design assets from Figma.

Implement user authentication using PlayFab or Firebase.

Develop an animated UI for an engaging user experience.

Milestone 2: Word Database and Game Mechanics (7 days)

Create and store word database using PlayFab or Firebase.

Implement game mechanics, including image display, audio playback, and answer options.

Milestone 3: Timer and Scoring System (4 days)

Integrate the timer functionality to count down available question time.

Develop scoring system to calculate and display player accuracy percentage.

Milestone 4: Level Completion and Feedback (5 days)

✓ Implement pass/fail conditions based on player score.

Design and integrate pop-ups for level completion feedback.

Enhance player experience with sound effects.

Milestone 5: Testing, Polishing, and Deployment (6 days)

Perform comprehensive testing to ensure smooth gameplay and quality.

Polish UI, addressing design and usability issues.

Prepare game for deployment on iOS and Android, complying with Play Store and App Store policies.

Provide support for publishing the game and assist with necessary app store submissions.

Key Features

✨ Top Quality Work: Delivering a high-quality game with captivating visuals and smooth performance.

Animated UI: Creating an immersive experience with visually appealing animated user interface.

GitHub Source Control: Utilizing GitHub for structured and organized development process.

Support for Publishing: Guiding and assisting in publishing the game, ensuring compliance with Play Store and App Store policies.

Post-Project Support: Offering ongoing support and assistance beyond project completion.
